# 1 Introduction

## 1.1 Name

*Mox* is a Latin adverb meaning "soon".

This alludes to my bad habit of coming up with ideas out of the blue, starting them, getting burned out within an hour, ditching them, and promising to come back to finish them "soon."

## 1.2 Purpose

This document serves as a repository of project ideas (most likely involving computer science) that I personally come up with or become interested in. These are projects I've thought of randomly, projects I've been thinking about for years, and everything in between. Ideas are listed with detailed descriptions of their theoretical use with limited reference to actual implementation as that can be left to actual projects if started.

I also get to learn L<sup>A</sup>T<sub>E</sub>X!

## 1.3 Motivation

On July 9th 2017, I decided that I needed a means of writing down all my potential project ideas somewhere in order to develop them (and not forget them!). I also happened to be learning L<sup>A</sup>T<sub>E</sub>X at the same time so I put two and two together and decided to kill two birds with one stone.

# 2 Ideas

**Ordering** Ideas will be ordered realistically in terms of feasibility, scope, and probability of them actually becoming a reality. Ideas deemed (by me) most likely to be attempted are listed first, and ideas least likely to become a reality will be listed last.
